> **Two addresses to remember**
>
> Website: **https://verticalsolar.com.ng**
> CRM: **https://verticalsolar.com.ng/admin** — the same address works on a phone, and staff can add it to their home screen like an app.

How it fits together

The website and the CRM are one system. Every form on the website — quote requests, support tickets, shop orders, newsletter sign-ups, and phone numbers shared with the chatbot — lands in the CRM as a customer record with a follow-up already scheduled. Everything you change in the CRM's *Website* section (testimonials, certificates, social links, pop-ups, packages, branches, FAQs, homepage text) appears on the website immediately, with no developer needed.

Part	Who uses it	What it does
Website	Customers, the public	Explains your services, sizes systems, takes quote requests and orders, answers questions through the AI assistant
CRM	Owner, managers, sales, customer care, store	Customers, quotes, installations, stock, support, analytics, website content, staff accounts
Field app	Installers and technicians	Clock in and out at the job site, send photos and a completion message

Screenshots in this manual were taken with sample data during testing; names and figures in them are examples.

Chapter 1

Going live

The code is on GitHub and the database is already set up and filled with your packages, projects, branches, FAQs and six blog articles. Four short steps put it online.

Step A — Connect GitHub to Cloudflare

1. Sign in at **dash.cloudflare.com** with the account that already holds the `vertical-solar-db` database.
2. Go to **Workers & Pages** → **Create** → **Import a repository**. Connect GitHub if asked and pick `Boymyke/vertical-solar-website`.
3. Fill in: Project name `vertical-solar` · Build command `npm run build` · Deploy command `npx wrangler deploy`. Leave the root directory as `/`.
4. Press **Create and deploy**. After a minute or two you get a temporary address ending in `.workers.dev`. Open it to check the site.

From now on, every change pushed to the `main` branch on GitHub is published automatically.

Step B — Point your domain at it

1. Your domain's DNS must be managed by Cloudflare. If `verticalsolar.com.ng` is not yet in your Cloudflare account, choose **Add a domain**, follow the prompts, and change the nameservers at your domain registrar to the two Cloudflare gives you.
2. Open the `vertical-solar` Worker → **Settings** → **Domains & Routes** → **Add** → **Custom domain**. Add `verticalsolar.com.ng`, then add `www.verticalsolar.com.ng` (it redirects to the main address).

> Switching the domain replaces the old WordPress site. Take a backup of anything you still need from the old hosting first (emails hosted there are not affected by the website change, but check with your host if your email uses the same server).

Step C — Create the owner account

1. Visit **/admin** on the new site. Because no one has signed up yet, it shows a one-time setup screen.
2. Enter the **setup code** sent to you in the chat, your name, your work email and a strong password (at least 10 characters with upper and lower case letters and a number).
3. You are signed in as **Owner**. The setup code is destroyed and the setup screen disappears for good.

Step D — Optional extras (add any time)

Some features need a secret key from another service. Secret keys are added in Cloudflare, never typed into the CRM: Worker → **Settings** → **Variables and Secrets** → **Add** → **type: Secret**.

Secret name	Get it from	Turns on
`RESEND_API_KEY`	resend.com → API Keys (verify your domain first)	Sending email from inside the CRM, and the morning summary email
`PAYSTACK_SECRET_KEY`	paystack.com → Settings → API Keys	Card payments in the shop (the public `pk_` key goes in CRM Settings)
`TURNSTILE_SECRET`	Cloudflare → Turnstile → Add widget	Invisible spam protection on forms (the site key goes in CRM Settings)

Without these, the system still works: email opens in Gmail or Outlook instead, and shop orders arrive as "order requests" that you confirm by phone.

Chapter 2

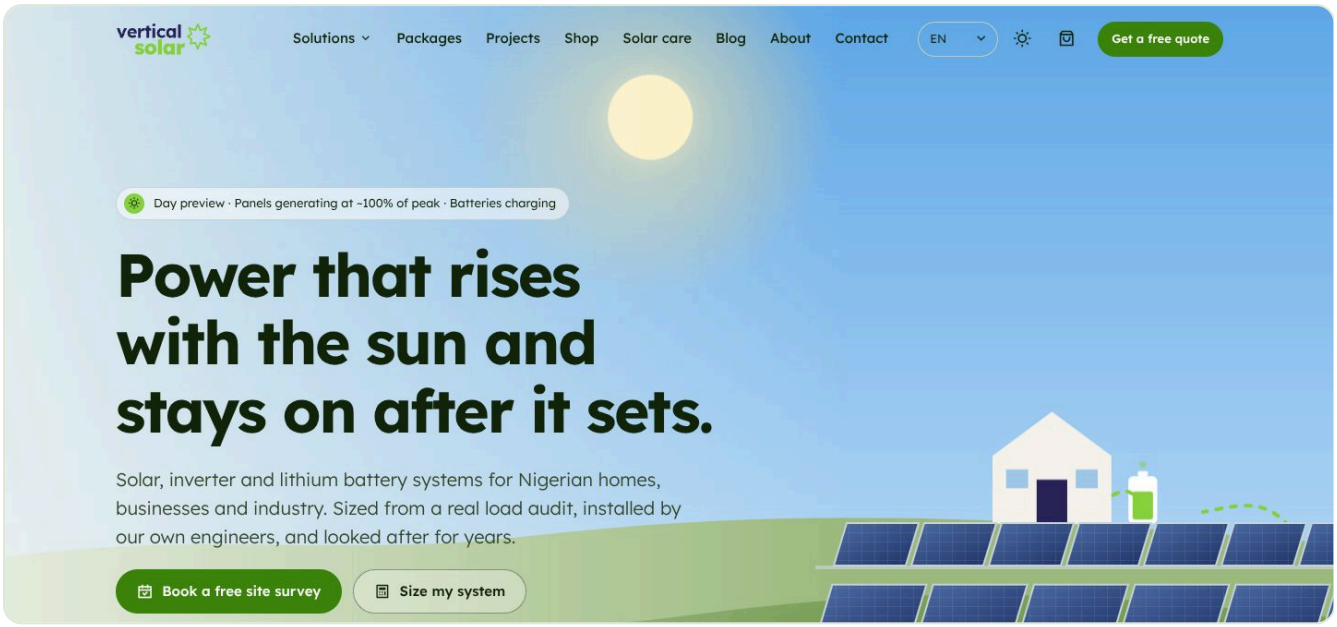

Your first 30 minutes

Do these once, in this order, and the website will be accurate and the team ready to work.

- ☐ **Settings** → **Company**: check phone numbers, WhatsApp number, email, address, opening hours, RC number.
- ☐ **Website** → **Homepage**: confirm the headline numbers (installations completed, year founded, branches). They show on the homepage, so make sure they are true.
- ☐ **Website** → **Branches**: confirm each branch address and phone. Drag the pin on the map if a location is off — the contact page map uses these.
- ☐ **Website** → **Packages**: confirm prices for lead-acid and lithium options. The load calculator recommends from this list.
- ☐ **Website** → **Certificates**: upload your certificates (NEMSA, CAC, manufacturer partnerships, etc.). They appear in the footer of every page.
- ☐ **Website** → **Social links**: check Facebook, Instagram, LinkedIn and TikTok links; add any others by picking an icon.
- ☐ **Website** → **Testimonials**: add real customer reviews with their consent and evidence (see chapter 17).
- ☐ **Inventory**: set prices, cost and stock for the 12 component products, and switch on "Show in shop" for those you want to sell online.
- ☐ **Settings** → **Shop & payments**: add bank transfer details, or switch the shop off until you are ready.
- ☐ **Users**: create logins for your team (chapter 5).
- ☐ **Installations**: create your current jobs with their site locations, then assign installers so they can clock in.

Chapter 3

The website at a glance

The homepage hero follows the real time of day in Lagos: sun and charging panels in the day, a night sky with the battery powering the house after sunset.

Pages

Section	Pages
Main	Home, About, Contact (map of all branches), Get a quote (3-step form)
Solutions	Residential, Commercial, Industrial
Buying	Packages and load calculator, Financing (pay monthly), Shop, Checkout
Proof	Projects (case studies), Testimonials
Help	Solar care guide, Blog, FAQ, Support (report a fault)
Legal	Privacy policy, Terms, Installation policy, Support policy, Accessibility statement

Day and night

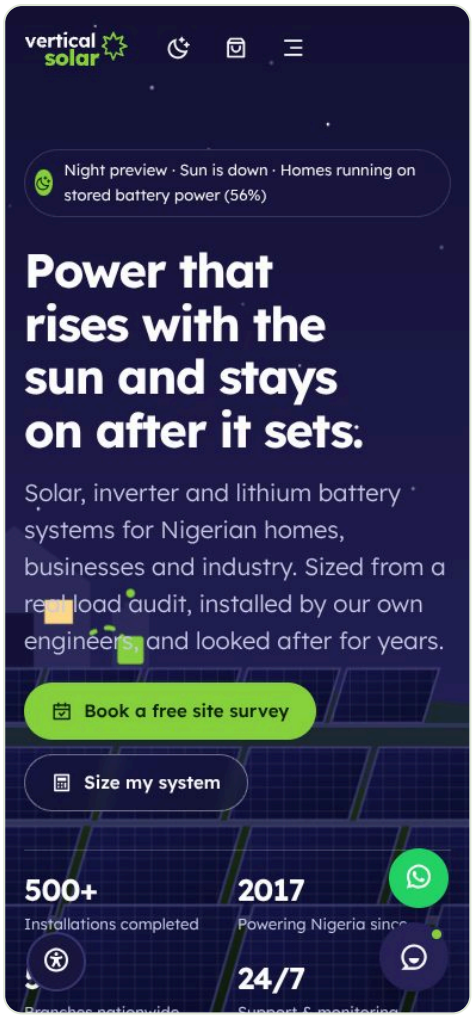

Visitors can switch between automatic, day and night look using the sun/moon button in the header. The choice is remembered on their device.

Languages

English, Igbo, Hausa and Yoruba from the language menu. Menus, buttons, forms and key page text translate; blog articles stay in English. More languages can be added later.

Accessibility

The round button at the bottom left (or **Alt + A**) opens tools for larger text, high contrast, a dyslexia-friendly font, highlighted links, a reading guide, stopping animations and reading the page aloud. The site works fully with a keyboard and screen readers.

On a phone

Sola, the AI assistant

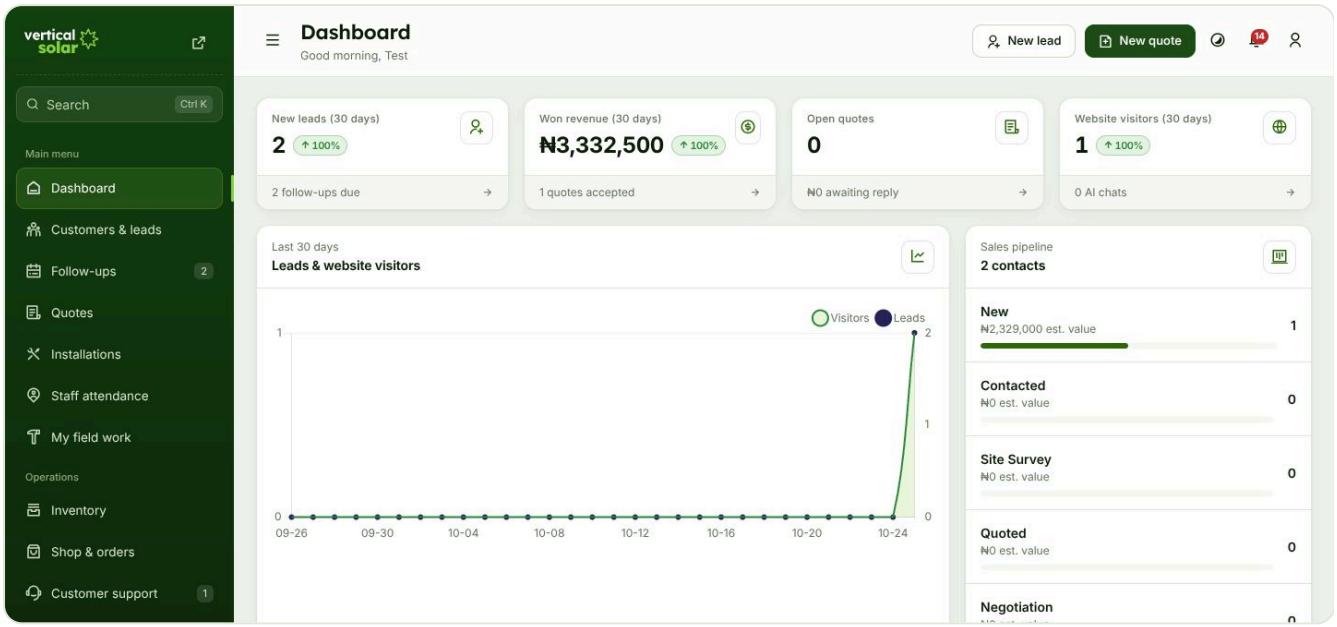

The chat bubble at the bottom right opens Sola. Visitors can type, dictate with the microphone, or switch on voice conversation so Sola answers out loud. Sola knows your packages, prices, branches, financing, FAQs and care advice, and links to the right page. When someone shares a phone number, they are saved as a lead. Every conversation is visible in the CRM, and your team can take over a chat live.

Search engines

Every page has its own title, description, social sharing image and structured data so Google understands your business, branches, FAQs, articles and products. A sitemap is generated automatically at `/sitemap.xml`; submit it once in Google Search Console after going live.

Chapter 4

Finding your way around the CRM

The dashboard: new leads, revenue won, open quotes and website visitors, with the sales pipeline beside the chart.

- **Menu** on the left, grouped into Main menu, Operations, Insights, Website and Admin. People only see the sections they have access to.
- **Search** (`Ctrl K`) jumps to any section or finds a customer.
- **New lead** and **New quote** buttons are always at the top of the dashboard.
- The **bell** shows notifications: new website leads, chat hand-overs, staff leaving a site, low stock, quotes accepted, and more.
- The half-moon button switches the CRM between light and dark.
- On a phone the menu folds behind the ☰ button. Tables turn into cards.

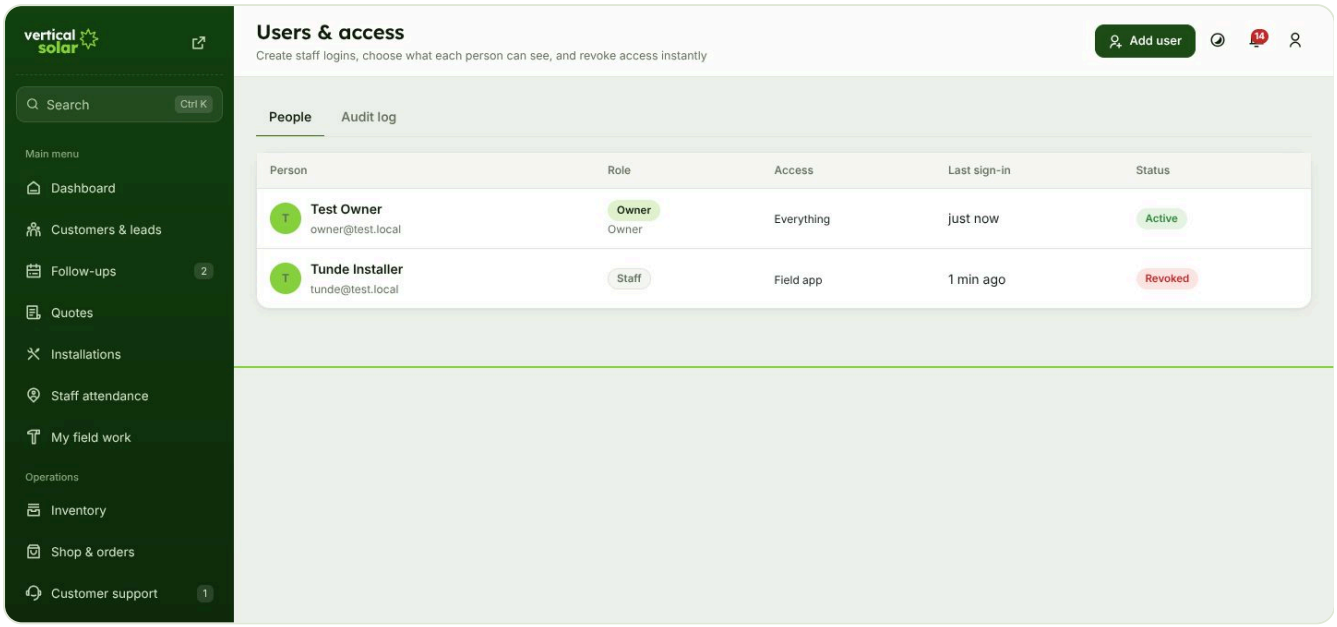

Signing in

Everyone signs in with their work email and password at **/admin**. New staff get a temporary password and must choose their own on first sign-in. After six wrong passwords, the account is locked for 15 minutes. Sessions last 7 days on a device; changing a password signs out all other devices.

To change your own name, phone or password: click your profile icon (top right) → **My profile**.

Chapter 5

Users, roles and access

Three kinds of account

Role	What they can do
Owner	Everything, always. Only one, created at setup. Cannot be revoked by anyone else.
Admin	Uses only the sections you tick. If you tick *Users, roles & access*, they can create and manage other users, but can only give away sections they have themselves.
Staff	Uses only the sections you tick. A typical installer has just *Field app*.

Add a person

1. **Users & access** → **Add user**. Enter name, work email, phone and job title.
2. Choose Staff or Admin, then tick the sections they may use — or click a preset such as *Field technician*, *Sales rep*, *Customer care*, *Store keeper*, *Marketing*, *Site supervisor* or *Manager*.
3. Click **Create login**. A temporary password is shown once. Copy the login details and send them privately (in person or by direct message).

Change, revoke, reset

- Click a person to change their sections. They are signed out so the new access applies straight away.
- **Revoke access** signs them out on every device immediately; their history stays. **Restore access** undoes it.
- **Reset password** creates a new temporary password if someone forgets theirs.

- **Delete** removes the login permanently. Revoking is usually better, because it keeps the name on their past work.

Sections you can grant

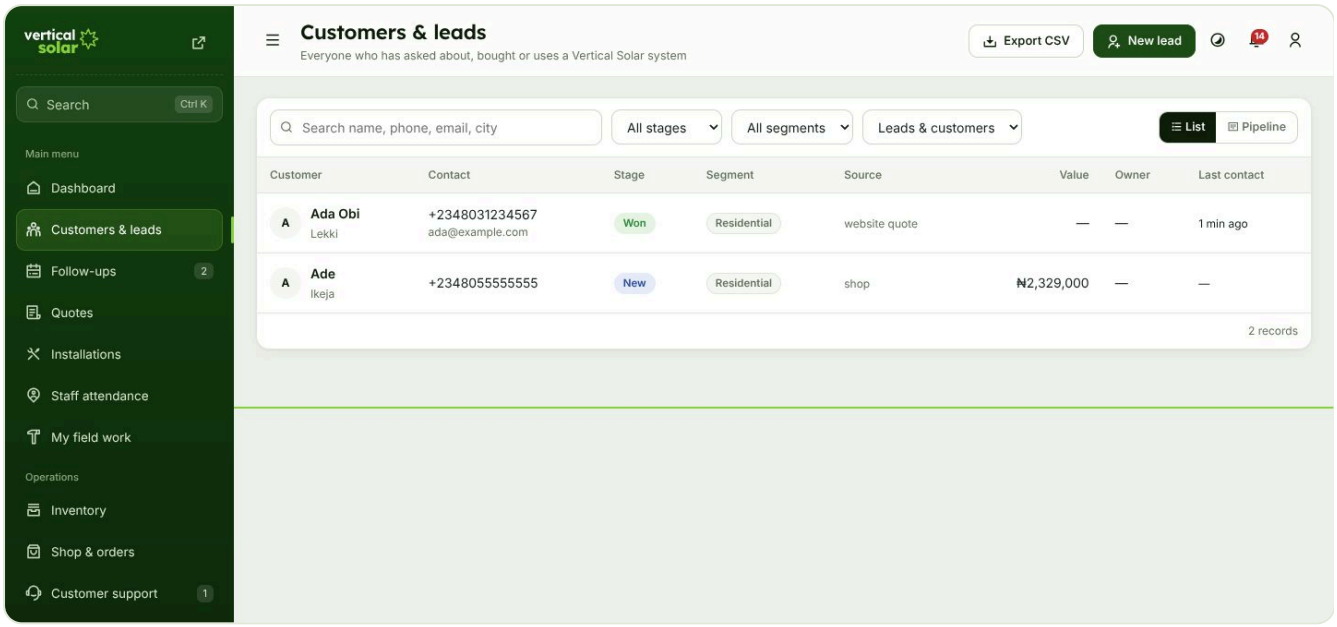

Dashboard · CRM & Sales · Follow-ups · Quotation engine · Installation tracking · Staff attendance · Field app · Inventory · Online shop & orders · Customer support · Maintenance & warranties · Analytics & heatmaps · Website chats · AI sales assistant · Website content · Blog · Email · Users & access · Company settings

Audit log

The **Audit log** tab records sign-ins, user changes, deletions, quote sends and other important actions, with who did it and when.

Chapter 6

Customers, leads and pipeline

Every person or company you deal with is one customer record. Website forms, chats, shop orders and support tickets create or update records automatically; if the same phone number or email comes in twice, it joins the existing record instead of making a duplicate.

Pipeline stages

New → Contacted → Site survey → Quoted → Negotiation → Won / Lost. Switch between the **list** and the **board** view; on the board, drag a card to move it to the next stage.

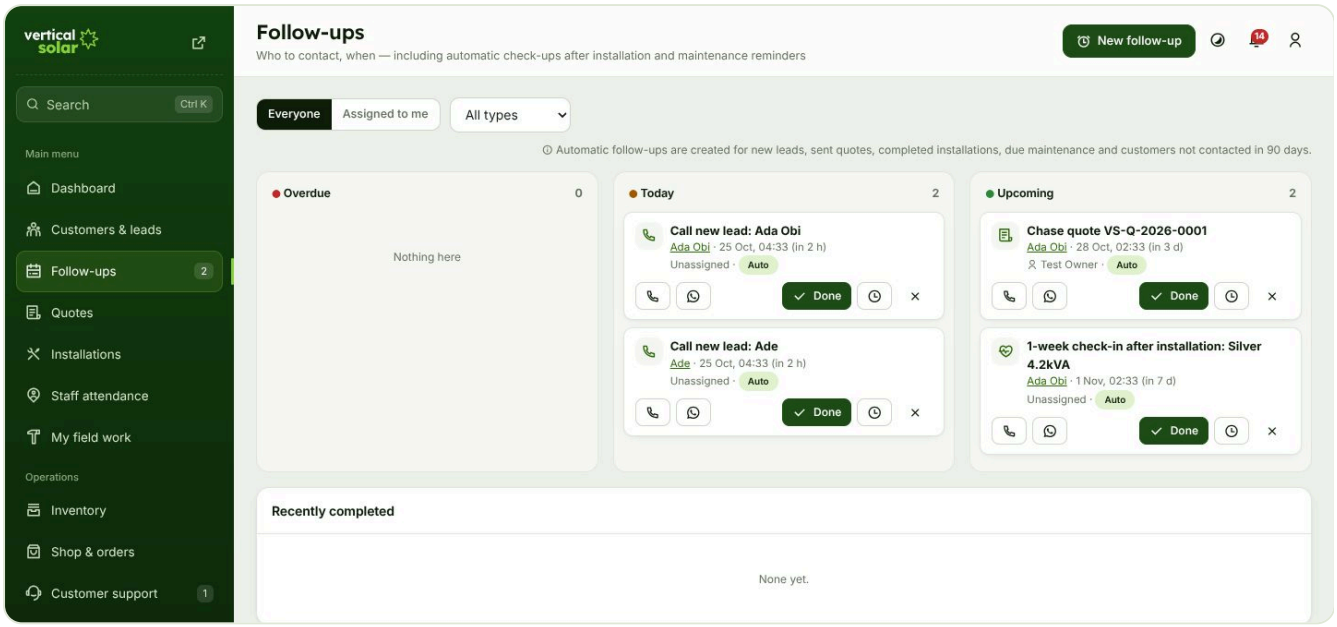

Inside a customer record

- Contact details, location, segment (home, business, industrial), what they are interested in and an estimated value.
- **Timeline**: every call, note, email, quote, installation, ticket, order, chat and warranty in one place, newest first.
- **Log activity** after each call or visit, and set the next follow-up date in the same step.
- Quick buttons to call, WhatsApp or email them, or create a quote.
- Assign the customer to a sales rep, who then sees them under their name.

Export downloads the current list as a CSV file for Excel or Google Sheets.

Chapter 7

Follow-ups

Follow-ups tell you **who to contact and when**. They are grouped into Overdue, Today and Upcoming. Each one has buttons to call or WhatsApp the customer, mark it done (with a note), or snooze it.

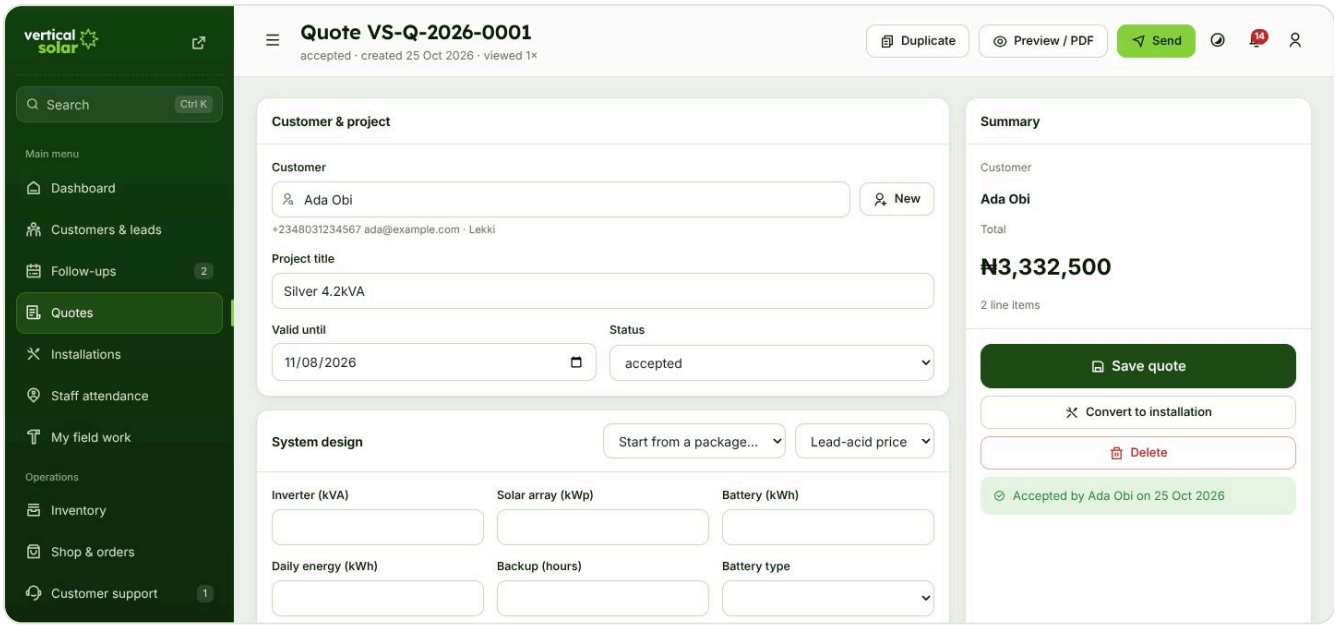

Created for you automatically

When	Follow-up
A new lead comes in from the website or chat	Call within 2 hours
A quote is sent	Check whether they have questions
An installation is completed	1-week check-in, then routine maintenance reminders
A customer has not been contacted for 90 days	Relationship check-in (good for referrals)
A warranty is about to expire	Offer an extended maintenance plan

If email sending is set up, the people listed in Settings → Integrations get a morning summary of new leads, follow-ups due, low stock and expiring warranties.

Chapter 8

Quotes

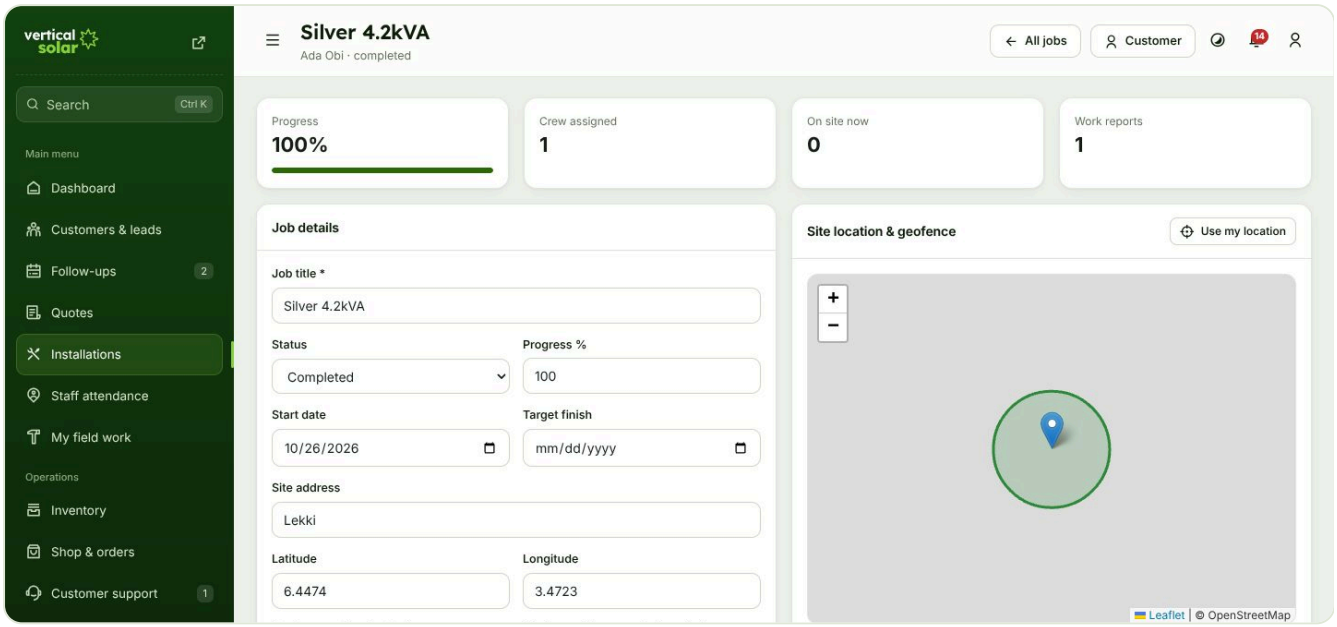

1. **Quotes** → **New quote** (or *New quote* from a customer record). Pick or create the customer.
2. Fill in the system design: inverter size, solar array, battery, backup hours. **Start from a package** fills everything from one of your packages at lead-acid or lithium prices.
3. Add line items by typing, or **Add from inventory** to pull in products with their prices. Discount and VAT are calculated for you.
4. Check payment terms and validity date, then **Save**. **Preview / PDF** shows exactly what the customer will see and downloads a branded PDF.
5. **Send**: by WhatsApp, by email, or copy the link. The customer opens a branded quote page where they can download the PDF, **accept** or **ask for changes**.

You see when the quote was opened and how many times. When the customer accepts, you get a notification and the customer moves to *Won*. **Convert to installation** then creates the job with the system details already filled in. **Duplicate** is handy for sending a second option (for example, lithium instead of lead-acid).

Quotes past their validity date are marked expired automatically.

Chapter 9

Installations and job sites

The green circle is the clock-in zone (geofence). Staff must be inside it to clock in.

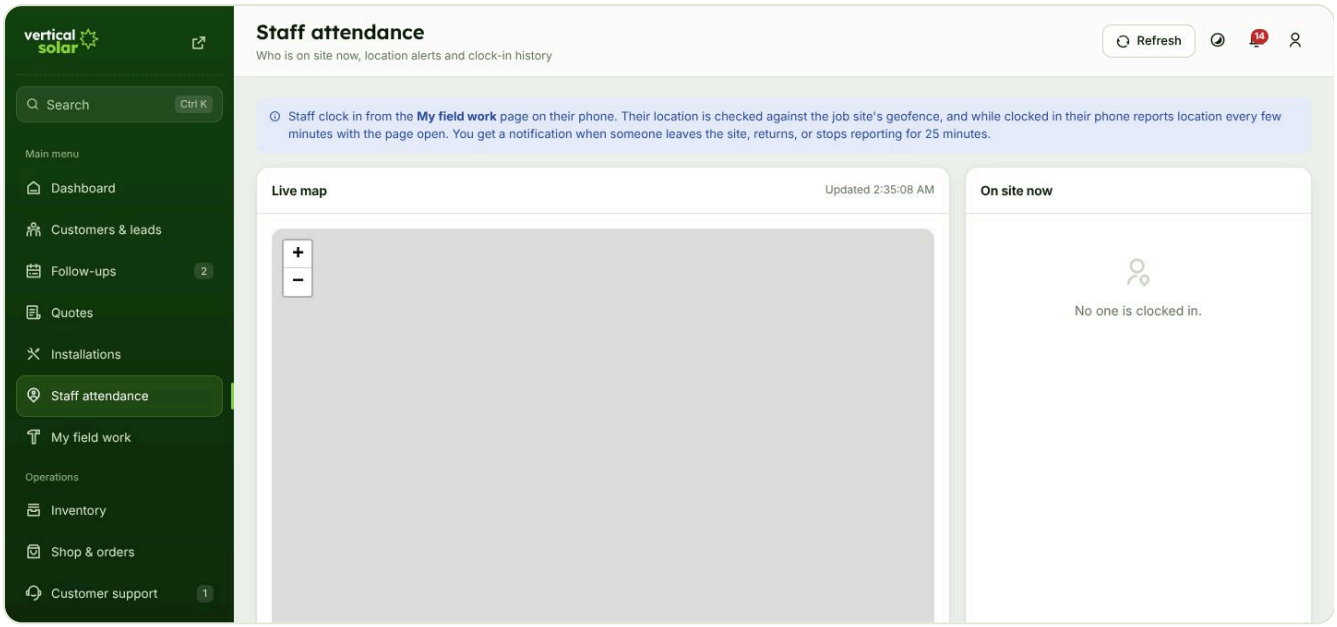

1. **Installations → New job** (or convert an accepted quote). Give it a title, customer, dates and the system installed.
2. Set the **site location**: click the map, type latitude/longitude, or press *Use my location* while standing on site. Choose a **geofence radius** — 100–200 metres suits most homes; larger for estates and industrial sites.
3. **Assign the crew**. Assigned staff see the job in their field app and can clock in there.
4. Track progress with the status (Scheduled, In progress, On hold, Completed) and the progress percentage.
5. Review **work reports** as they come in — photos, messages and progress from the crew. **Mark reviewed** and add feedback the crew sees in their app.

When you mark a job Completed

The system automatically creates the **warranty** record (workmanship months you set on the job), schedules the first **maintenance visit** (every 6 months by default) and adds a **1-week check-in** follow-up.

Chapter 10

Staff attendance and location alerts

- **Live map** shows who is clocked in and where they were last seen, with the site circles.
- **On site now** lists everyone currently clocked in and how long they have been there.
- **History** filters by date and staff member, shows hours worked and time spent off site, and exports to CSV for payroll.

How the checks work

Event	What happens
Clock in from outside the circle	Refused. The app tells them how far away they are.
Leaves the site while clocked in	Managers with attendance access get a notification ("left site").
Comes back	A "back on site" notification, and the time away is recorded.
Phone stops reporting for 25 minutes	"Lost contact" notification (phone off, no data, or app closed).
Forgets to clock out	Closed automatically after 14 hours and flagged.

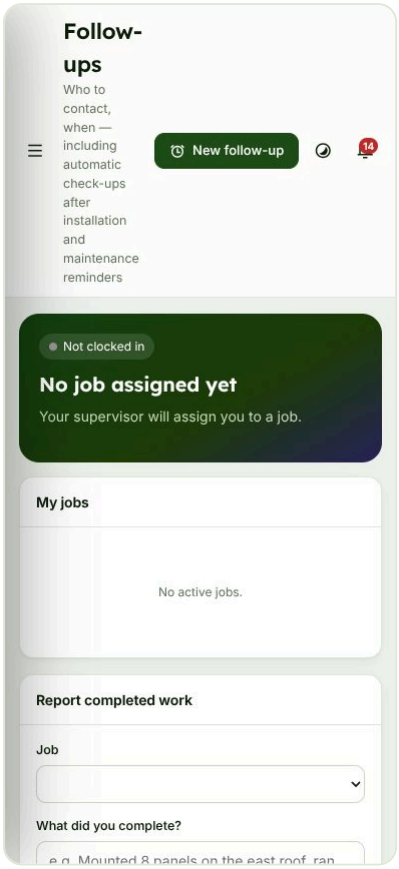

Managers can close a clock-in by hand and add a note (for example, if a phone died).

> **Good to know:** phones only report location while the field app page is open. The app keeps the screen awake and reminds staff to leave it open. For best results, ask installers to add the CRM to their home screen and keep it open during the job.

Chapter 11

The field app — guide for installers

This page can be printed and given to each installer.

Before your first job

1. Open the login link your manager sent, sign in with your work email and temporary password, then choose your own password.
2. Add it to your home screen: in Chrome tap ⋮ → *Add to Home screen*; on iPhone Safari tap Share → *Add to Home Screen*.
3. Allow **location** when asked. Without it you cannot clock in.

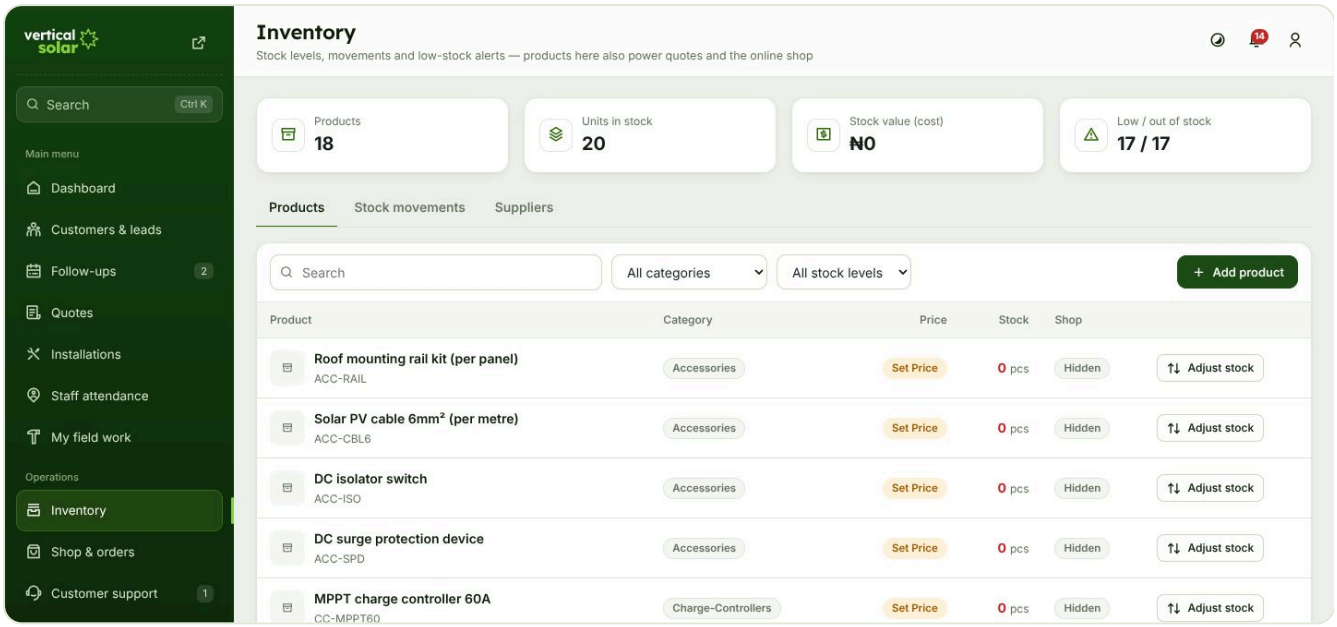

On site

1. Open **My field work**. Your jobs for today are listed.
2. Stand at the site and tap **Clock in**. If it says you are too far away, move closer or ask your manager to check the site pin.
3. **Keep the app open** while you work. It keeps the screen awake and quietly confirms you are on site.
4. Under **Report completed work**: take or choose photos (before, during, after — up to 10), write what you did and any issues, and slide the progress bar to show how far the job is. Tap send. Your manager's feedback appears under your reports.
5. Tap **Clock out** before leaving.

> If you have to leave the site (to buy materials, for example), your manager is notified automatically. Clock out if you will be away for long.

Chapter 12

Inventory, shop and orders

Inventory

- **Products**: SKU, category, brand, price, cost, stock, reorder level, warranty, photos and specifications. A red badge marks items at or below their reorder level.
- **Adjust stock** records stock received, used on a job, returned, or a count correction, with a reason. Every change is listed under **Stock movements**.
- **Suppliers** keeps supplier contacts in one place.
- Stock value at cost and at selling price is shown at the top.

The online shop

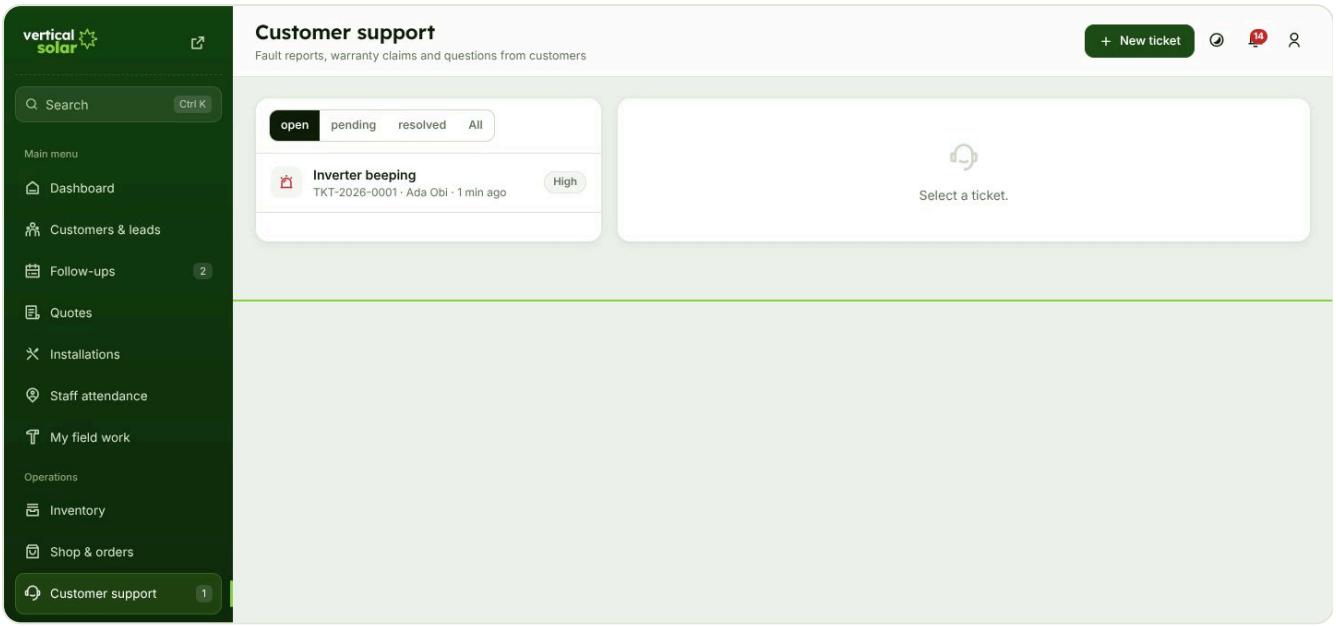

- Turn the whole shop **on or off** with the switch on *Shop & orders* (or Settings → Shop). When off, the Shop menu and product pages disappear from the website.
- Each product has its own **Show in shop** switch. Products priced at ₦0 never show.
- **Checkout mode**: *Order request* (customer orders, you call to confirm and take payment by transfer) or *Paystack* (card/transfer payment online — needs the Paystack keys).

Orders

New orders notify the team. Move each one through Pending → Processing → Paid → Delivered (or Cancelled). Stock is deducted automatically when an order is marked paid. Paystack payments are verified with Paystack before an order is marked paid.

Chapter 13

Support tickets

Customers report faults on the website's **Support** page; you can also open tickets yourself from a phone call. Each ticket has a category, a priority, a status (Open, Pending, Resolved), an assigned staff member and a thread of replies and internal notes.

- Urgent tickets (no power, burning smell, water damage) are highlighted.
- The ticket links to the customer record, so their system, warranty and history are one click away.
- Need a site visit? Book it under Maintenance & warranty for the same customer.

Chapter 14

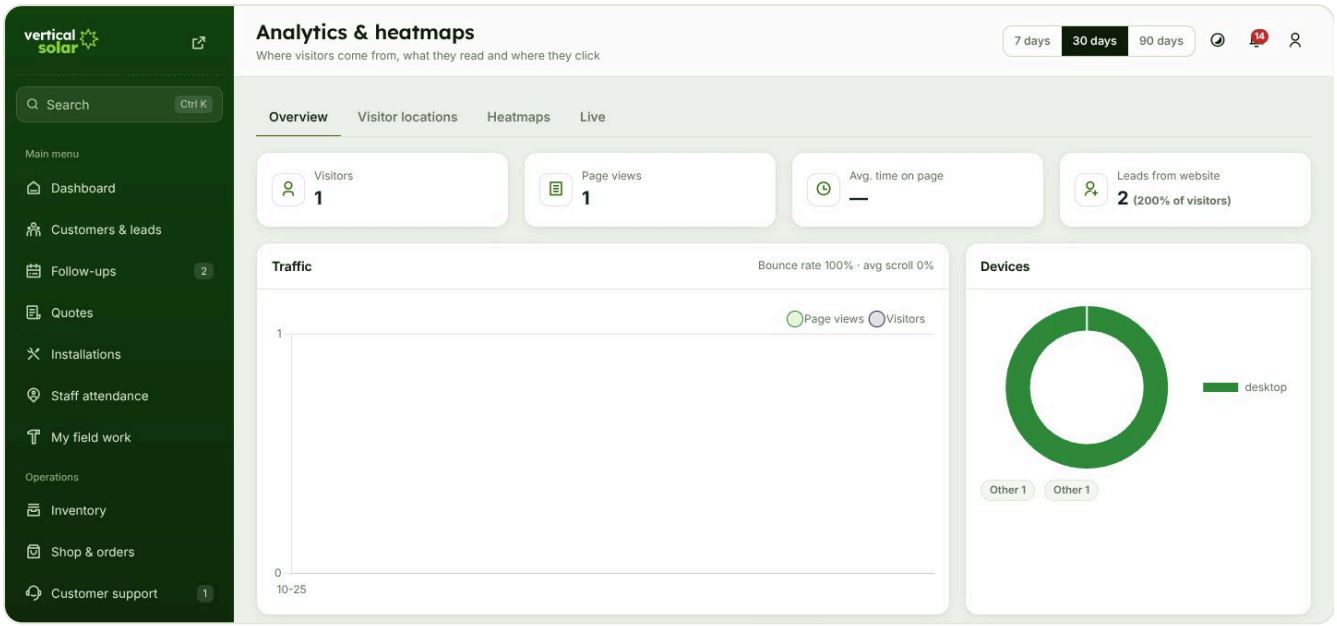

Maintenance and warranties

Maintenance visits lists scheduled, overdue and completed visits. Assign a technician, set the date, record the findings after the visit, and the cost if it was a paid call-out. Customers due for maintenance get a follow-up automatically.

Warranties lists every warranty — workmanship and equipment (with serial number and provider) — with start and end dates. Warranties expiring in the next 30 days are flagged and create a follow-up so you can offer a maintenance plan.

Chapter 15

Analytics and heatmaps

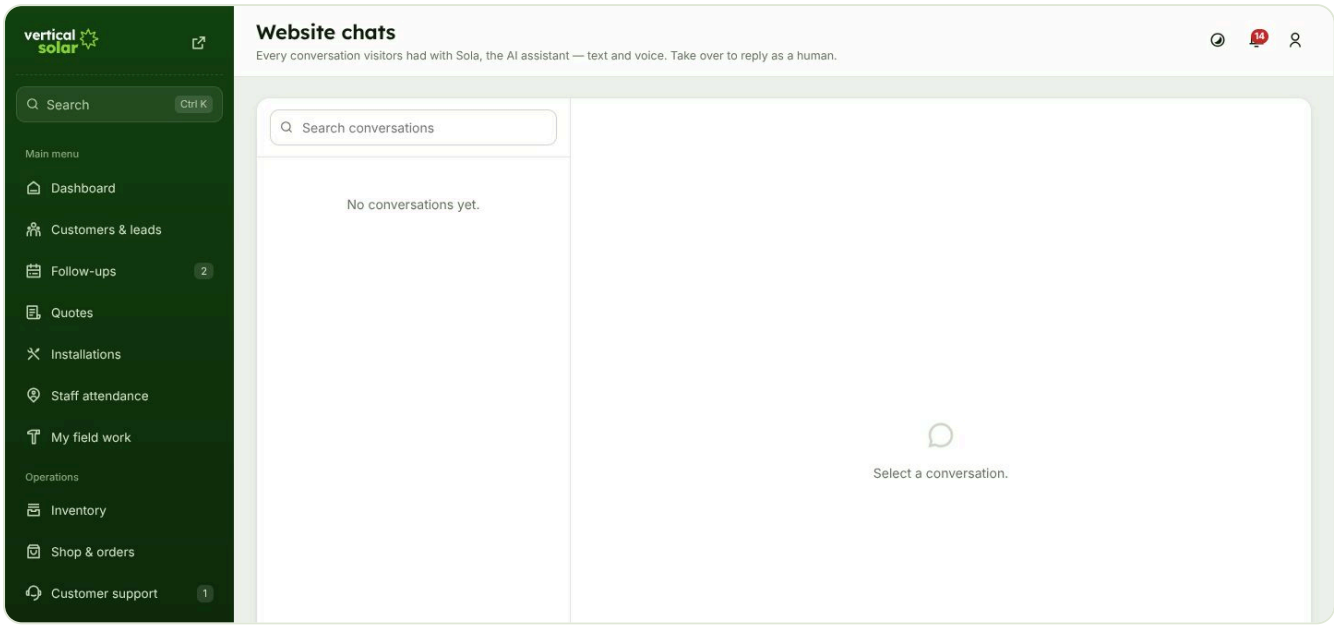

Tab	Shows
Overview	Visitors, page views, time on page, leads from the website, traffic over time, devices, top pages with scroll depth, where visitors came from (Google, Facebook, WhatsApp, direct), and which forms produce leads.
Visitor locations	A map and table of countries, states and cities your visitors are in.
Heatmaps	Pick a page to see it with a heat overlay of where people click and move. Red patches are the hottest spots. "Rage clicks" (repeated frustrated clicking) are highlighted — usually something that looks clickable but isn't.
Live	Who is on the site right now and which page they are on.

Analytics is privacy-friendly: no cookies, no IP addresses stored, and location is approximate (city level). Visitors can opt out on the privacy page. If you also want Google Analytics, add your GA4 ID in Website → SEO & features; it only loads for visitors who accept cookies.

Chapter 16

Website chats and the AI assistants

Website chats

- Every conversation visitors have with Sola is listed, newest first, with the page they were on and their city. Voice conversations appear as text.
- **Take over** pauses Sola so a person can reply directly; the visitor sees your replies in the chat window. **Hand back** lets Sola continue.
- If a visitor shares a phone number, the chat is linked to a new or existing customer record.

Teaching Sola

Sola already knows your company details, packages and prices, branches, FAQs and website pages. Add anything else — promotions, brands you stock, policies — under **Website → AI assistant → Extra knowledge**. Change the name and greeting there too.

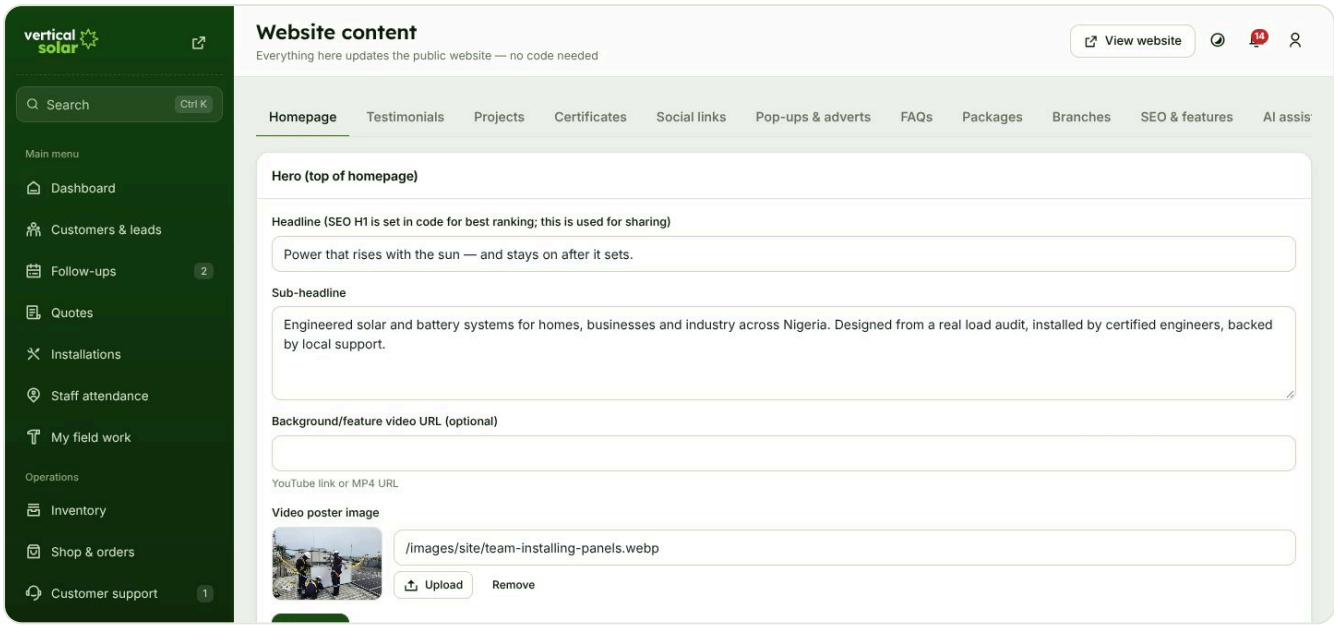

AI sales assistant (inside the CRM)

Helps your team write a follow-up message, summarise a customer, answer an objection ("it's too expensive"), size a system from a list of appliances, or review the pipeline and suggest who to call. Always read what it writes before sending.

> The AI runs on Cloudflare Workers AI. Normal use costs very little and is billed with your Cloudflare account; a daily free allowance covers light traffic.

Chapter 17

Editing the website

Everything under **Website** updates the live site as soon as you save.

Tab	What you control
Homepage	Headline, sub-headline and the four numbers under it
Testimonials	Customer reviews with photo, rating, system installed, savings and evidence
Projects	Case studies with photos and system sizes; they get their own page
Certificates	Shown in the footer of every page; click opens the certificate
Social links	Choose a platform icon from the icon picker and paste the link; shown in the footer of every page
Pop-ups & adverts	Corner card, centre pop-up or top banner; which pages; when it appears; start and end dates; how often
FAQs	Questions on the FAQ page (Google can show them in search results)
Packages	Packages, prices and the loads they run; used by the calculator, quotes and Sola
Branches	Addresses, phones, hours and map pins
SEO & features	Site title and description, sharing image, Google Analytics ID, switch the blog, testimonials, chat and voice on or off
AI assistant	Assistant name, greeting and extra knowledge

Testimonials must be real

To protect your reputation, the system will not publish a testimonial unless you tick **Customer consented**. Add evidence wherever possible: installation photos, a short video link, or link it to the real project and customer record. Ticking **Verified** shows a "Verified customer" badge on the website. Never invent or edit reviews to say something the customer did not say.

Pop-ups that work

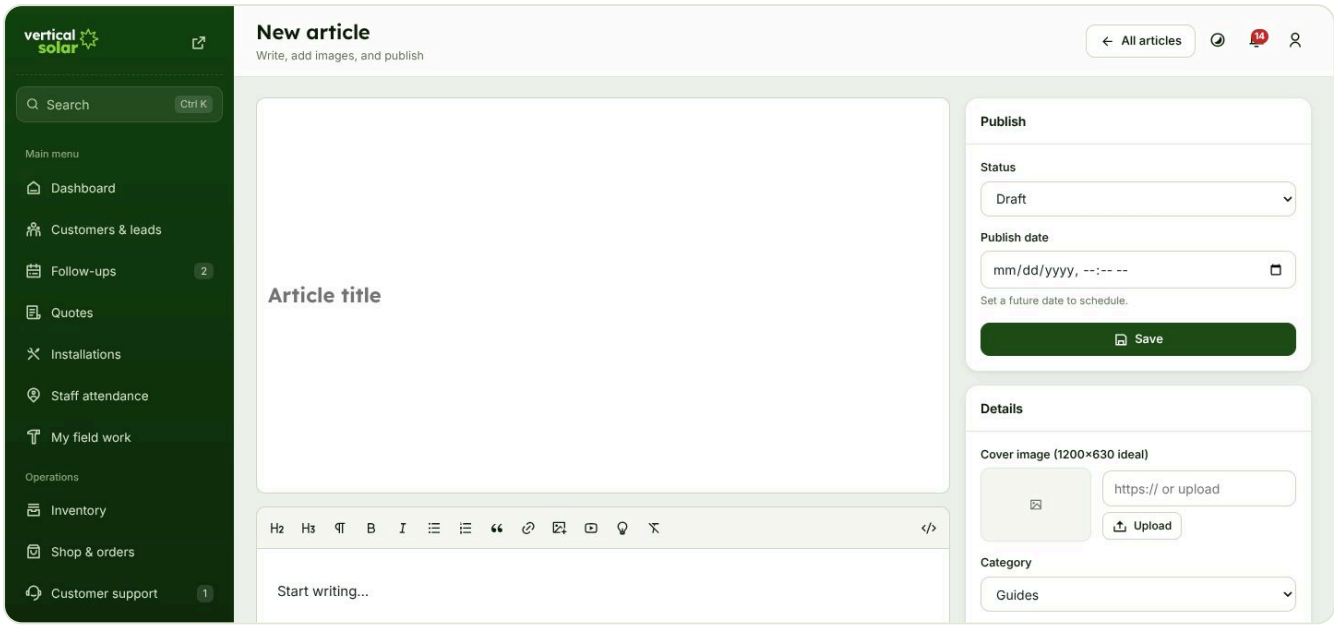

One offer at a time; a clear button; an end date. The *corner card* style is the least annoying. You can see how many people saw and clicked each pop-up.

Images

Upload JPG, PNG or WebP photos. Landscape photos about 1600 pixels wide look best. Photos are stored safely in Cloudflare and served fast across Nigeria.

Chapter 18

Blog

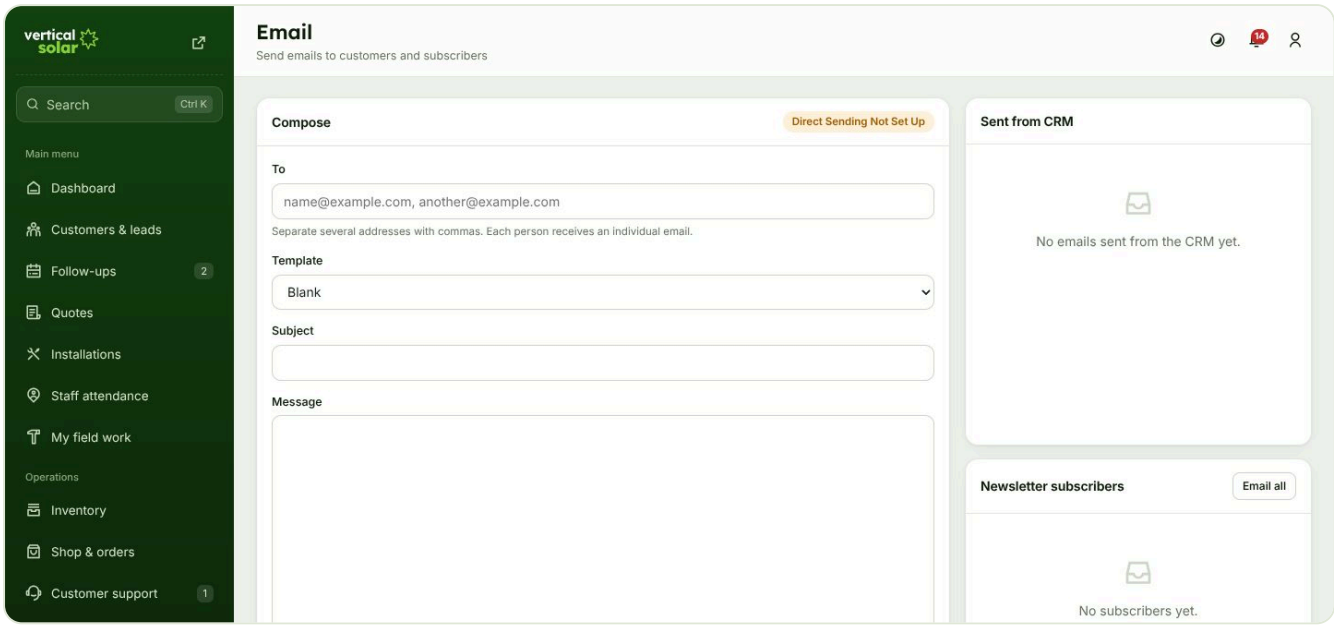

1. **Blog → New article**. Add a title, a cover image and write the article. The toolbar adds headings, lists, links, quotes, images and tables.
2. Choose a category, write a one-sentence excerpt (shown on the blog list), and check the search engine title and description.
3. Save as **Draft** to keep working, or **Publish**. You can also set the publish date.

Six articles are already published: sizing a home system, lithium vs tubular batteries, solar vs generator costs, panel care in harmattan and rainy season, inverter alarms, and the MM2 Plaza case study. Aim for one or two new articles a month answering questions customers actually ask — it is the most reliable way to grow Google traffic.

Chapter 19

Email

Write an email to one customer or several addresses at once (each person receives their own copy). Ready-made templates cover enquiry follow-ups, maintenance reminders and thank-you/referral requests. Newsletter subscribers from the website are listed beside the composer, with a button to add them all.

- **With Resend set up** (chapter 1, step D): emails send from the CRM using your domain, and each one is logged on the customer's timeline.
- **Without it**: the same screen opens your message in Gmail, Outlook or your phone's mail app, ready to send — and still logs it.

Chapter 20

Settings and payments

Tab	Contains
Company	Name, legal name, tagline, email, phones, WhatsApp, address, hours, RC number — used on the website, quotes, emails and by Sola
Shop & payments	Shop on/off, checkout mode, Paystack public key, delivery fee and note, bank transfer details shown on orders and quotes
Integrations	Email "from" name and address, who gets the morning summary, Turnstile site key. Shows whether each secret key has been added in Cloudflare.

Chapter 21

Security and privacy

Built in

- Passwords are stored in a scrambled, one-way form; no one, including developers, can read them.
- Accounts lock after repeated wrong passwords; forms and the chatbot are rate-limited against abuse; hidden spam traps on every form; optional Cloudflare Turnstile.
- Each section checks permissions on the server, not just by hiding menu items.
- Strict browser security headers protect against cross-site scripting, clickjacking and similar attacks. The whole site runs on HTTPS.
- Uploaded files are checked to be real images or PDFs. Article text is cleaned of unsafe code.
- Important actions are written to the audit log.
- Cloudflare protects the site against DDoS attacks and keeps a restore history of the database (D1 Time Travel), so it can be rolled back to an earlier point.

Your part

- [ ] Use a long, unique password for the owner account and never share it. Create separate logins for each person instead.
- [ ] Revoke access the day someone leaves.
- [ ] Give each person only the sections they need.
- [ ] Turn on two-factor authentication on your Cloudflare and GitHub accounts.
- [ ] Never paste secret keys into the CRM, chat or email; they belong only in Cloudflare secrets.

Privacy (NDPA 2023)

The privacy policy explains what is collected and why. Staff location is collected only while clocked in, and only for attendance — tell staff this when you create their accounts. Delete customer data on request from the customer record.

Chapter 22

Daily and weekly routine

Every morning

- [ ] Dashboard: new leads overnight
- [ ] Follow-ups: clear Overdue and Today
- [ ] Website chats: anything waiting for a person
- [ ] Support: new and urgent tickets
- [ ] Attendance: who is on site

Every week

- [ ] Pipeline board: move stuck deals forward
- [ ] Quotes: chase unopened and opened-but-unanswered quotes
- [ ] Installations: approve work reports, close finished jobs
- [ ] Inventory: reorder low stock
- [ ] Analytics: top pages and lead sources

Every month

- [ ] Publish one or two blog articles
- [ ] Add new completed projects with photos
- [ ] Ask happy customers for a testimonial with photos
- [ ] Check heatmaps on Home, Packages and Get a quote
- [ ] Refresh pop-up offers and package prices
- [ ] Review users and remove access no longer needed

Chapter 23

Troubleshooting

Problem	Try this
Installer cannot clock in — "too far"	Check the site pin on the installation map; widen the radius; make sure the phone's location is set to high accuracy and the browser has location permission.
"Lost contact" alerts	The installer closed the app, the phone slept or had no data. Ask them to keep the field page open.
Locked out after wrong passwords	Wait 15 minutes, or ask an admin to reset the password.
Someone can't see a section	Users & access → tick the section → Save. They will be asked to sign in again.
Email "not configured"	Add `RESEND_API_KEY` in Cloudflare and verify your domain in Resend; or use the Gmail/Outlook buttons.
Shop not showing	Shop switch is off, or the products have no price or "Show in shop" is off.
Changes not showing on website	Refresh the page. Phones may hold the old page for a few minutes.
Chatbot says it is busy	A brief AI outage or usage limit. Visitors are offered WhatsApp and phone instead.

Chapter 24

What still needs your input

Item	Why
Real testimonials	The reviews on the old site could not be verified, so none were carried over. Add genuine ones with consent and evidence.
Certificates	Upload NEMSA, CAC, partner and training certificates so they show in the footer.
Component prices and stock	The 12 component products (panels, inverters, batteries, accessories) are hidden until you add a price and stock.
Headline numbers	"500+ installations" and the other homepage numbers are editable — confirm they are accurate.
Igbo, Hausa and Yoruba	Translations should be reviewed by a native speaker on your team; send corrections and they can be updated.
Photos and video	More real installation photos (and a short video) will lift the Projects and Solutions pages. Add a video link to any project or testimonial.
Bank details	Add in Settings → Shop & payments so they appear on orders and quotes.
Google Search Console	Verify the domain and submit `/sitemap.xml` so Google indexes the new pages quickly.
