

Selling the new Vertical Solar platform

A playbook for pitching the website and CRM to Vertical Solar: what to show, what to say, how to price it, and how to hand it over.

Prepared for the delivery team

October 2026

10 What we need from them

11 Be straight with them

12 Their brief, ticked off

Demo links

Website: **https://vertical-solar.aiwebcourse.workers.dev**
CRM: **https://vertical-solar.aiwebcourse.workers.dev/admin**
Code: **github.com/Boymyke/vertical-solar-website**

The demo runs on our Cloudflare account. It moves to their domain, verticalsolar.com.ng, after they sign.

Chapter 1

The pitch in one page

Vertical Solar doesn't need a prettier brochure. It needs a system that turns website visitors into installations and keeps those customers coming back. That's what we built.

The one-sentence version

> *"Your new website brings in the leads, and the CRM behind it makes sure every one of them gets a call, a quote, an installation and a maintenance visit, with your staff's site attendance tracked on the way."*

Three outcomes to keep repeating

1. **More leads, captured properly.** Every quote request, chat, order and support ticket becomes a customer record with a follow-up already scheduled. Nothing lives in someone's WhatsApp anymore.
2. **Faster, more professional selling.** A branded quote goes out as a link or PDF in minutes. The client accepts it online, and the job is created with one click.
3. **Control over field work and after-sales.** Installers clock in only at the job site, and managers are alerted if they leave. Warranties and maintenance visits schedule themselves, which is where repeat revenue and referrals come from.

Who is in the room, and what each person cares about

Person	Cares about	Show them
Owner / MD	Revenue, reputation, control	Dashboard, pipeline value, quote acceptance, staff attendance alerts
Sales lead	Leads and closing speed	Lead arriving from the site, follow-ups, quote by WhatsApp, AI sales assistant
Operations / installs	Crews, sites, materials	Installations with geofence, field app on a phone, work-photo reports, inventory
Customer care	Complaints, maintenance	Support tickets, maintenance visits, warranty expiry, chat takeover
Marketing	Brand and traffic	Day/night photo hero, languages, blog, pop-ups, analytics and heatmaps

Chapter 2

Where Vertical Solar is today

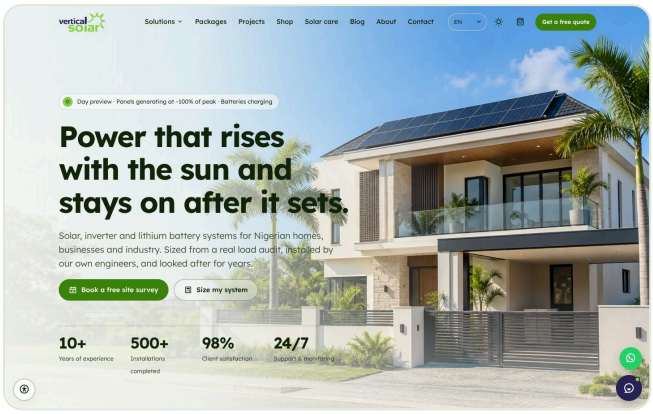

Open with their current situation. Keep it respectful, because they paid for the current site. The point isn't that it's bad. It was built to be a brochure, and the business has outgrown it.

Today	What it costs them
One long page that has to cover everything	Hard to rank on Google for "solar installation Abuja" or "lithium battery price". There's no room for depth on any single topic.
Enquiries arrive by phone, WhatsApp and email	No single list of leads, no record of who followed up, and leads get forgotten.
Quotes are made by hand	Slow turnaround and inconsistent pricing. They can't tell whether a client has even opened the quote.
No view of installers on site	They rely on trust and phone calls to know whether a crew is actually at the job.
No maintenance or warranty reminders	Repeat revenue and referrals are lost. Unhappy customers only call when something breaks.
English only, no live help after hours	They miss customers who are more comfortable in Igbo, Hausa or Yoruba, and visitors who browse at night.
Reviews on the page can't be traced to real customers	Savvy buyers notice, and it weakens trust at the moment of decision.

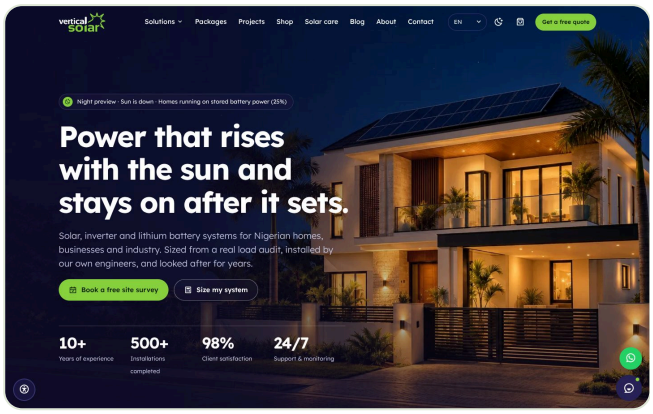

> **Ask, don't tell.** "How many enquiries did you get last month? How many got a quote? How many of those quotes do you know were opened?" Most owners can't answer, and that's your opening.

Chapter 3

What we built, in their words

Daytime: the house in full sun, panels charging.

After sunset: the same house lit by its batteries.

The website

- A full multi-page site with separate pages for homes, businesses and industry, plus packages with a load calculator, financing, projects, a shop, a blog, a solar care guide, FAQ, contact, quote and support pages.
- The hero photo follows the real time in Lagos. It shows the house in sun by day and lit by batteries at night, which tells the story of what they sell without a word.
- The whole site is in English, Igbo, Hausa and Yoruba, including content they add later.
- Sola, an AI assistant, answers questions by text or voice, links to the right page, and saves phone numbers as leads.
- An accessibility panel for visitors with low vision, dyslexia or motor difficulties.
- Built for Google: separate pages, structured data, a sitemap and fast loading on Cloudflare's network.

The CRM

- Customers and pipeline, follow-ups, a quote engine with link, PDF and online acceptance, installations, attendance with geofencing, a field app, inventory, shop orders, support tickets, maintenance and warranties, analytics and heatmaps, chat inbox, an AI sales assistant, email, website content and users with per-section access.
- Everything on the website (testimonials, certificates, social links, pop-ups, packages, branches, FAQs, blog) is edited from the CRM. No developer needed.

The full feature list is in chapter 12, matched line by line to their original brief.

Chapter 4

Before the meeting

A demo that breaks loses the deal. Spend 30 minutes the day before on this list.

- [ ] Open the CRM at `/admin` and complete the one-time setup with the setup code. Use your own email for the demo owner account.
- [ ] Create a staff login (role: Field technician) and sign into it on a second phone. That phone is your "installer".
- [ ] Create one installation whose site pin is **the meeting room's location** (press "Use my location" while you're there, or drop the pin on the map). Assign the staff login to it. This makes the clock-in demo work live.
- [ ] Submit one quote request yourself from the website, so the dashboard isn't empty when you start.
- [ ] Create one pop-up offer that matches a real promotion they run.
- [ ] Upload one of their certificates if you have it, so it appears in the footer.
- [ ] Check both day and night look using the sun/moon button, so you can switch on cue.
- [ ] Test the chat on mobile data, not only Wi-Fi.
- [ ] Charge both phones and bring a hotspot. Don't depend on their Wi-Fi.
- [ ] Have this PDF and the live links ready to send by WhatsApp straight after the meeting.

> **Testimonials:** the four reviews from their old site are loaded into the CRM as unpublished drafts. Show them where reviews live, and explain that a review only goes live once the customer's consent is recorded. Don't publish them during the demo.

Chapter 5

The 25-minute demo script

Tell it as a customer's journey: a family in Lekki finds them at night, gets a quote, gets installed, and is looked after for years. Each step shows a feature without calling it one.

Act 1: The visitor (8 minutes)

1. **Open the homepage on the big screen.** Click the sun/moon button to switch to night.

   > *"At 9pm, when the neighbourhood is dark, this is what a visitor sees: your customer's home with the lights still on. Every visitor understands the product in one look."*

2. **Switch the language to Yoruba, then Hausa.**

   > *"Every page, form and price is translated. Someone in Kano can read the whole site in Hausa."*

3. **Go to Packages and use the calculator.** Add a fridge, fans, a TV and an inverter AC. It recommends a package and the generator payback.

   > *"This replaces the first 10 minutes of every sales call. They arrive already knowing roughly what they need."*

4. **Open the chat and ask by voice:** "How much is a 5kVA system and can I pay monthly?"

   > *"That's Sola. It knows your prices, branches and financing, and it links to the right page. When they share a phone number, they become a lead in your CRM."*

5. **Submit a quote request** from the Get a quote page, using the client's own name if they're happy to.

Act 2: The sale (7 minutes)

1. **Switch to the CRM dashboard.** The new lead is there, with a follow-up due in 2 hours.

   > *"Nobody had to copy anything. The lead and the reminder to call are already here."*

2. **Open the customer and show the timeline.** Log a call.

3. **Create a quote:** "Start from a package", then add an item from inventory, and Preview / PDF.

   > *"Branded, consistent, with your bank details and terms. About two minutes."*

4. **Send it by WhatsApp to your own phone**, open the link, and press Accept.

   > *"You can see when they open it, and you get a notification when they accept."*

5. **Click "Convert to installation".**

Act 3: The installation (6 minutes)

1. **Show the installation map** with the green geofence around the site.
2. **On the "installer" phone, open My field work and clock in.** It works because you're inside the circle.

   > *"If they try this from home, it refuses and tells them how far away they are. If they leave the site during the day, you get a notification."*

3. **Send a work report with two photos** from the phone. Show it arriving on the job in the CRM.
4. **Mark the job Completed.** Show the warranty and first maintenance visit that were created automatically.

   > *"Six months from now, your team is reminded to visit. That's repeat business and referrals you currently leave on the table."*

Act 4: Control (4 minutes)

1. **Analytics and heatmaps:** where visitors come from, which pages they read, and where they click.
2. **Website section:** change the homepage headline under Website → Homepage, then refresh the site to show it updated instantly. Change it back afterwards.
3. **Users:** create a "Sales rep" login with the preset, then revoke it.

   > *"When someone leaves, one click and they're out on every device."*

4. **Close with the question:** "Which of these would make the biggest difference to you this month?" Then stop talking.

Chapter 6

The numbers that close it

Talk in installations, not features. Use their own prices, which are already on the site.

₦2,501,000
Silver 4.2kVA package, lead-acid (their price)

₦7,739,000
Ruby 7.5kVA commercial package, lead-acid (their price)

1 extra sale
The only assumption the case needs

A worked example

Ask them for their typical gross margin on a home system, and don't guess it for them. Then fill this in together:

Line	Their number
Extra home installations per month from better follow-up and the website	_____
Average package value (for example, Silver at ₦2,501,000)	_____
Gross margin %	_____
Extra gross profit per month = sales × value × margin	_____
Maintenance visits per month that currently don't happen	_____
Hours a week spent making quotes by hand	_____

> Once they've written their own margin down, the conversation changes. If a single extra installation covers the project, the decision is easy. Let them do the arithmetic, because numbers they produce themselves are the ones they believe.

Running costs to mention up front

- **Hosting:** Cloudflare's free tier covers launch traffic. Their Workers paid plan is a small monthly fee once traffic grows.
- **AI assistant:** Cloudflare Workers AI is billed by usage and includes a daily free allowance. Light chat traffic costs very little.
- **Optional services:** Resend for sending email from the CRM, and Paystack for card payments (Paystack charges per transaction).

Check current Cloudflare, Resend and Paystack pricing on their websites before quoting exact figures.

Chapter 7

Pricing the deal

Price against the value from chapter 6, not your hours. Offer three options and expect them to pick the middle one.

Option	What's included	Your price
Website	Public website, languages, AI assistant, blog, CMS for content, analytics. CRM limited to leads and website content.	_____
Website + CRM Recommended	Everything in this playbook: full CRM, quotes, installations, geofenced attendance, field app, inventory, support, maintenance and warranties.	_____
Website + CRM + growth	Everything above, plus monthly blog articles, real photography of their installs, Google Search Console and Business Profile setup, and quarterly reporting.	_____

Monthly care plan (sell it with every option)

- ✓ Hosting management, backups and security updates
- ✓ Small changes and new pages each month (set a limit)
- ✓ Staff training for new hires
- ✓ A monthly report on leads, conversion, heatmap insights and recommendations

Payment terms that protect you

- A deposit on signing, with the balance due at go-live (the domain switch).
- Hosting stays on your account until the balance is paid. After that, transfer it or keep it under the care plan.
- Paystack activation, Resend email and extra languages are add-ons, each with its own price.

Chapter 8

Handling objections

They say	You say
"We already have a website."	"You have a brochure. This is a sales system. Your current site can't tell you which enquiries got a quote or whether your installer was on site. How do you track those today?"
"It's too expensive."	Go back to chapter 6. "If it brings one extra Silver installation, what's that worth to you? Let's spread the payment over the care plan if cash flow is the issue."
"We manage fine with WhatsApp and Excel."	"Keep WhatsApp. Quotes and follow-ups still go out on WhatsApp from the CRM. What changes is that nothing gets lost when a phone is changed or a staff member leaves."
"My staff won't use it."	"Installers only see one screen: clock in, send photos, clock out. Sales sees their own leads. We train everyone, and the presets mean each person sees only what they need."
"Tracking staff location is too much."	"It only works while they're clocked in for a job, and only checks the job site. It isn't tracking their life. It protects good installers from accusations as much as it catches absent ones."
"Is our customer data safe?"	"Passwords are stored in scrambled form, logins lock after repeated failures, each person gets only the sections they're given, every important action is logged, and it all runs on Cloudflare's network. You can revoke anyone instantly."
"What if you disappear?"	"The code is in a GitHub repository and the site runs on Cloudflare. Neither depends on us. We can transfer both to accounts you own."
"Can the AI say something wrong?"	"It can, which is why it's limited to your published prices and pages, and every chat is visible in the CRM. Your team can take over any conversation live."
"We'll think about it."	"Of course. Which part are you unsure about? If it's timing, we can launch the website first and switch on the CRM modules one team at a time."

Chapter 9

After they say yes

Go-live in five steps

1. **Domain.** Add verticalsolar.com.ng to Cloudflare (change nameservers at the registrar), then attach it to the Worker under Settings → Domains & Routes. Change `SITE_URL` in `wrangler.jsonc` to the real domain and push.
2. **Owner account.** If you used the setup code for the demo, create their owner-level admin account with every section ticked, or transfer ownership by resetting the email on the owner account.
3. **Content.** Load their real testimonials (with consent), certificates, real project photos, bank details and staff list (chapter 10).
4. **Integrations.** Add `RESEND_API_KEY` for email and `PAYSTACK_SECRET_KEY` when card payments are approved. Both go in Cloudflare as secrets. Switch card payment on in Settings → Shop & payments.
5. **Training.** Run a 1-hour session per team (sales, operations, installers, customer care), using the user manual in the repository.

Moving hosting to their own Cloudflare account (if they ask)

1. They create a Cloudflare account and invite you as a member, or you walk them through it.
2. In their account, create the D1 database and R2 bucket with the same names and update the IDs in `wrangler.jsonc`.
3. Export the database from your account and import it into theirs, then copy the uploaded media.
4. Import the GitHub repository in their dashboard, as was done for the demo. Point the domain at the new Worker, check it, then delete the demo Worker.

First 30 days

- [ ] Week 1: check every lead was called, and fix any process gaps
- [ ] Week 2: review attendance alerts with operations and adjust site radii
- [ ] Week 3: publish two blog posts, and submit the sitemap in Google Search Console
- [ ] Week 4: send a first monthly report showing leads, quotes sent and accepted, top pages and heatmap notes

Chapter 10

What we need from them

Item	Why
Real testimonials with customer consent, ideally with an installation photo	Reviews only go live once consent is recorded. Real ones convert far better than anonymous ones.
Certificates (NEMSA, CAC, manufacturer partnerships)	Shown in the footer of every page as proof of credibility.
Photos of their own installations and team	To replace the illustrative photos over time (chapter 11).
Component prices and stock levels	The 12 components in the shop stay hidden until priced.
Bank details for transfers	Shown on orders and quotes.
Staff list with roles	To create logins with the right access.
Domain registrar login, or someone who has it	For the nameserver change at go-live.
A native speaker for Igbo, Hausa and Yoruba review	To polish the translations before launch.
Paystack business account (when ready)	To switch on card payments.

Chapter 11

Be straight with them

Being honest here builds the trust that renews a care plan. Say these things before they discover them.

Some of the generated photos used on the inner pages.

- **The lifestyle and hero photos are generated illustrations** made for the launch. Project pages use their real installation photos. Plan to replace the generated images with real shoots of their customers and crews, with permission. It also fits the care plan nicely.
- **Their old site's reviews are saved as drafts, not published.** They couldn't be traced to real customers. Once each customer confirms, publishing takes one click.
- **Translations are thorough but machine-assisted.** A native speaker should review them before launch. Anything added later is translated automatically and can be refined.
- **Card payments are visible but switched off** until their Paystack account is approved. Orders currently come in as requests confirmed by phone.
- **Staff location only updates while the field app is open** on the phone. That's a limit of web apps, and installers should keep it open during jobs.
- **The homepage numbers** (10+ years, 500+ installations, 98% satisfaction) come from their current site. They should confirm them, and they can edit them in the CRM.

Chapter 12

Their brief, ticked off

Hand this page over. It shows that every item in their original request was delivered.

They asked for	Delivered as
Standard multi-page website, animated, mature, SEO-friendly	27 pages, server-rendered blog, project and product pages, structured data, sitemap, and a single orchestrated day/night hero
Day/night "solar panel" feel	Hero photo that follows the real time in Lagos, with day and night themes
Branding from the logo, their colours, icon pack, matching fonts	Logo traced from their file, palette 88D23F / 282358 / 144211 / 1E3C0A / 408D0D, Remix Icon, Lexend headings to match the logo
Blog with images, published by admin	Blog editor with images, drafts and publish dates
AI chatbot with links, voice-to-text, voice-to-voice and chat, visible to admins	Sola: text, dictation, voice conversation, page links, lead capture, CRM inbox with live takeover
Igbo, Hausa, Yoruba (more later)	The whole site translated, with automatic translation for new content and new languages added by file
Accessibility	Accessibility panel, read aloud, keyboard navigation, reduced-motion support
How to care for solar	Solar care page with seasonal checklists and read-aloud
Security	Hashed passwords, lockouts, rate limits, CSP, permission checks, audit log
Visitor locations and heatmaps in the CRM	Analytics: locations, top pages, scroll depth, click and rage-click heatmaps, live visitors
Shop that admin can switch on and off	Shop with switch, per-product visibility, orders and stock deduction
Admin creates accounts and access, revokes, makes other admins	Users & access with role presets, per-section permissions, instant revoke, audit log
Staff clock in and out by location, alerts if they leave the site, photos and completion message	Geofenced field app, off-site, back-on-site and lost-contact alerts, work reports with photos
Quotes sent as a link or PDF	Quote engine: package start, inventory items, PDF, WhatsApp or email link, online acceptance
Inventory	Products, stock movements, suppliers, low-stock alerts

Follow-up system	Automatic follow-ups after leads, quotes, installs, 90 days of silence and expiring warranties
CRM & Sales, Quotation, Installation, Inventory, Support, Analytics, AI Sales Assistant, Maintenance & Warranties	All present as CRM sections
Certificates in the footer, social links from an icon pack, pop-ups and adverts	Website section: certificates, social icon picker, pop-up builder with schedule
Testimonials of real people with evidence	Testimonials with photo, video, project link and verified badge, publishable only with consent
Admin sends emails	Email composer with templates, sending through Resend or opening in Gmail or Outlook
Responsive website and CRM	Both work on phones, and the CRM installs to the home screen
